

14)What are negative indexes and why are they used?

ans)

- In python the index are usually counts from 0.
- While to take the last nth index -1 or the negative index are used.
- Negative index counts the index from the last taking it first.

For eg.- if in a index there five names be-

["a","b","c","d","e"]

Then- 0 , 1 , 2 , 3 , 4 is the index order

But- for negative index 4=-1 is used instead writing the last index number.
