

4) How memory is managed in Python?

Ans)

- Memory in python is managed automatically compared to other programming languages like c, c++ etc
- Python use private heap while you make any program or give any variable immediately, Every thing is internally tracked for better manage in python.
- Python keeps counting to keep the program and memory clean. When the counting is done or zero the memory gets cleaned.
- Python also has a garbage collector that takes care of more complex cases.

conclusion)

- Python automatically creates, tracks, and cleans up memory in the background, which is why you usually don't worry about memory management while coding in it.
